8 March 2023 0030 UTC

Outline

- Why set up an online SDR?
- Hardware/software options - browser based versus dedicated software
- Receive-only antennas versus all purpose - sharing with a transceiver
- Public access considerations - IP addressing, bandwidth, NAT security, etc
- Keeping things alive while unattended

Three Disclaimers...

1. Say what?
2. One week ago, I lost $\frac{1}{2}$ of my wisdom...

3.

Why set up an online SDR?

- Public service - “a good antenna is a *terrible* thing to waste” (Bruce, KX4AZ)...*share* that panadapter view!
- Radio “ears” for the signal impaired
- Checking modulation/splatter via area receiver
- Compare antenna receive performance to your peers
- Motivate receiving improvements (noise reduction, S/N focus)
- Leap the skip zone by accessing distant SDRs

Hardware/Software Options - Browser Accessible

Browser based access to these server types...

- *WebSDR* (websdr.org) - massive user capacity, Linux only, example:Lumpkin SDR in Dahlenega
- *KiwiSDR* - plug & play, server pre-installed, 0-30 MHz simultaneous view, 8 simultaneous users maximum, used for 'KX4AZ/A' SDR
- *OpenWebRX* - use RTL-SDR, Airspy HF+, SDRPlay etc., Linux based, Pi image available

Hardware/Software Options - Non-browser Receiver Software

- *Spyserver* (airspy.com) - works with RTL-SDR, Airspy HF+, SDRPlay etc. Spyserver runs on Windows or Linux. Access via SDR#.
- *SDR Console* (sdr-radio.com) - Windows *only*
- *SDR++* (sdrpp.org)
- *SDRuno* (sdrplay.com)

OpenWebRX Software (openwebrx.de)

- Web interface to access, configure
- Linux based; Pi4 disk images for turnkey solution
- Compatible with RTL-SDR, Airspy, SDRplay etc SDRs
- Compatible with SDRPlay devices (8-10 MHz bandwidth)

Clients [1]

KiwiSDR Online SDR @KX4AZ

- 0-30 MHz full bandwidth display
- Current URL (as of March 2023):
athenshouse.ddns.net:46708
- Up to 8 simultaneous users (2 w/full waterfall, 6 w/audio FFT)
- EFHW 80-10 antenna, 35' AGL
- antenna shared with ICOM 7300

Baby Steps...try out Spyserver

- Install RTL-SDR etc on a Windows PC, get comfortable with using SDR# to access
- Install Spyserver on the same PC, configure
- Access on your LAN via SDR# software
- Set up outside access (port forwarding or VPN w/port forwarding)

More advanced
steps...use
OpenWebRX or
WebSDR on a
Pi4 or Linux PC

- Install OpenWebRX or WebSDR on a Linux PC or Raspberry Pi
- Configure software for the specific SDR and desired bands
- Access via you LAN to fine tune settings
- Set up WAN side access via port forwarding or VPN etc.

Receive Only Antennas - Break Some “Rules”

- Reciprocity for transmit/receive - yes, BUT....

....non-resonant, poor match, no LNA, no problem - IF it passes the noise floor test!
- Noise floor test - does the noise floor increase when the antenna is connected to the feedline?
- Feedline options - coax (RG-6, RG-8x, ethernet twisted pair, ladder line, etc)...unmatched line loss *much* more tolerable for RX-only
- Don't forget the common mode choke(s) “CMC”
- Beware strong broadcast stations (AM/FM) - may require filter to prevent overload, “I’m talking to you, RTL-SDR!”

Hosting Considerations

- Know your ip addresses and behavior (LAN, WAN, CG-NAT (“Double-NAT”))
 - Use port forwarding, VPN etc to reach from outside
 - Dynamic ip address? Use no-ip.com etc
 - Know your upstream internet bandwidth (speedsmart.net)....figure 100kbits/second per user
-
- Sharing antenna with transceiver?
Need an automatic switch (MFJ-1708B etc)

Adding protection to the LAN...

- Use non-standard port #s; i.e. NOT ports like 80, 8080, 8001, 8073, etc that are in software defaults
- Ideally, segment your LAN so that the IOT and SDR devices are walled off from the rest of the network
- Segment using router such as Ubiquiti ER-X edgerouter (Amazon, \$58).

Keeping things alive at a remote site...

- Lightning arrestor, and thorough grounding a la Ward Silver N0AX, and *hope for the best*
- Appliance timer(s) or wifi controlled power outlet(s)
- Power failures can be your friend!
- Internet connection monitor - auto reboot modem with loss of connectivity
- A friend/neighbor you trust!

Your homework assignment...

- Set up that unused SDR (RTL-SDR, SDRPlay, Airspy) with Spyserver or OpenWebRX or SDR Console or SDR++ etc.
- Share the internet address at [ARC groups.io](https://groups.io)
- Compare your antenna/noise performance to others in the area
- Experiment with CMC at rig and where coax enters the house

Online SDR Resources

- “University of YouTube”
- RTL-SDR.com (all things SDR related)
- Openwebbrx.de (openwebbrx software)
- Airspy.com (Spyserver, SDR# software)
- Kiwisdr.com (KiwiSDR map, forum)
- Lumpkin WebSDR (Dahlonaga, GA)
<http://websdr.lumpkinschools.com/>

Networking Resources

- [Ngrok.com](https://ngrok.com) (tunneling through CG-NAT)
- [Cloudflare tunnel](https://cloudflare.com/tunnel) (tunneling through CG-NAT)
- [Tailscale.com](https://tailscale.com) (mesh VPN across devices at different sites)
- [Zerotier.com](https://zerotier.com) (mesh VPN across devices at different sites)
- [PureVPN.com](https://purevpn.com) (example commercial VPN with port forwarding option)

That's all Folks!
